Reflection

The most useful CSS selector in this assignment was the class selector because I could apply the same style to multiple parts of my cybersecurity website. I used reusable classes for highlighted information and notes, helping the pages look consistent without repeating the CSS rules. The difference between the margin and the padding is that the margin creates space outside an element's border, while padding creates space between the content and its border. The box model helped me organize the website by giving text and information boxes enough room. Borders helped separate sections and make certain content easier to notice.

I encountered a situation where a class rule overrode an element selector. A paragraph might receive a general text color from the p selector, but a paragraph with the ".note" class uses the more specific class rule instead. The change that most improved my website was adding consistent spacing and styling to the navigation, content sections, and information boxes. These changes made the pages easier to read and helped the site feel more organized.
